

CEZD members, we would like to gather your feedback on the following signal: Bovine Anaplasmosis in Ontario. Please take the time to review the signal description below and provide us with your relevance rating and/or comments (name optional).

The Ontario Ministry of Agriculture, Food and Rural Affairs (OMAFRA) has been notified of positive antibody results for bovine anaplasmosis in Southwestern Ontario, detected through a surveillance research project. On February 8th, 2021, OMAFRA was notified of one animal with a confirmed positive serology but negative PCR result for bovine anaplasmosis from a dairy herd after surveillance testing of a purchased animal. On February 22nd, 2021, laboratory testing confirmed 2 other animals from the same herd with antibody for bovine anaplasmosis. Positive antibody tests are suggestive of animals being asymptomatic carriers for the disease, but with no evidence of active infection.
